

Healthy average life expectancy (HALE) in Botswana

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a strong service coverage index (61.3/100), population in Botswana expected to live in average 57.5 years in "full health" in 2016. That represents an increase of about four (4) years compared to the value of 2010. In the period 2010-2016, HALE in Botswana seems to increase by about three (3) years each every 4 years.

In Botswana, women expect to live at least 4 years longer in "full health" than men (in the period 2010-2016).

Botswana was ranked 11 st out of 47 about HALE in the WHO African Region in 2016. However, compared to its neighbors, Botswana ranked first, ahead of Angola (55.8 years) and South Africa (55.7 years) in terms of HALE in 2016.
