

Healthy average life expectancy (HALE) in Eswatini

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a strong service coverage index (63/100), population in Eswatini expected to live in average 50.2 years in "full health" in 2016. That represents an increase of about 6 years compared to the value of 2010. Over the period 2000-2016, HALE in Eswatini seems to increase by about one (1) year each every 2 years.

In Eswatini, women seem to live in "full health" 4 years longer than men (over the period 2010-2016).

Eswatini was ranked 41st out of 47 for HALE in the African region in 2016. However, compared to its neighbors, Eswatini was ranked 3rd behind South Africa (55.7 years) and Mozambique (52.2 years).
