

Healthy average life expectancy (HALE) in Burkina Faso

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a weak service coverage index (39.7/100), population in Burkina Faso expected to live in average 52.9 years in "full health" in 2016. That represents an increase of about three (3) years compared to the value of 2010. In the period 2000-2016, HALE in Burkina Faso seems to increase by about three (3) years each every 5 years.

In Burkina Faso, men and women had almost the same healthy average life expectancy (in the period 2010-2016).

Burkina Faso was ranked 31 st out of 47 about HALE in the WHO African Region in 2016. However, compared to its neighbors, Burkina Faso was ranked fourth behind Ghana (56.4 years), Togo (53.9 years) and Benin (53.5 years) in terms of HALE in 2016.
