

Healthy average life expectancy (HALE) in Chad

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a weak service coverage index (27.8/100), population in Chad expected to live in average 47.2 years in "full health" in 2016. That represents an increase of about two (2) years compared to the value of 2010. Over the period 2000-2016, HALE in Chad seems to increase by about one (1) year each every 3 years.

In Chad, women seem to live in "full health" one year longer than men (over the period 2000-2016).

Chad was ranked 45nd out of 47 for HALE in the African region in 2016. However, compared to its neighbors, Chad was ranked fourth behind Niger (52.5 years), Cameroon (51.1 years) and Nigeria (48.9 years).
