

The Gambia STEPS Survey 2010

Fact Sheet

The STEPS survey of chronic disease risk factors in The Gambia was carried out from January 2010 to March 2010. The Gambia carried out Step 1 and Step 2. Socio demographic and behavioural information was collected in Step 1. Physical measurements such as height, weight and blood pressure were collected in Step 2. The STEPS survey in The Gambia was a population-based survey of adults aged 25-64. Probability proportional to size sampling was used in both the first and second stage of sampling to produce representative data for that age range in The Gambia. A total of 5,280 people were targeted for the study but only a total of 4,111 participated. The overall response rate was thus 77.9%.
